Remote Device Explorer PC/Windows

===== Remote Device Explorer is a reliable utility that enables you to extract information about a remote computer in your network, provided you have administrative privileges on that specific workstation. This application can prove

useful mostly to network administrators, enabling them to view detailed data regarding the specifications of any connected system. One of its strong points and main characteristics is simplicity, since the program features an intuitive GUI that packs all the options within a single window, not that there are many to deal with.

Actually, your only task is to enter the IP address that corresponds to the target remote PC and enter the credentials (username and password) of a user with administrative privileges. If the currently logged in user is an administrator, you don't even have to type in the username and password again, since Remote Device Explorer is smart enough to get it itself.

Once you fill in all the required fields, getting the device information is one click

away. Remote Device Explorer displays a list of all the standard system devices and the connected removable drives. For the first category it shows you the device description and class, the class GUID and other details, while the second category enables you to view additional information, such as the type and state of the device, the creation and the modification dates, serial number and the drive state. Remote Device Explorer provides a fast and convenient way to find out device information about a remote PC in the network. While it would be useful to have an exporting options to save data to file, the application can come in handy to any network administrator.

Features: ===== - Light weight and clean design - Simple intuitive interface - Extensive and rich information on available

devices - Get a detailed info about remote computer in the network - No installation or configuration required - Just click and view the remote system information - Support of Windows XP and Windows 7 and 64 bit OS - Show system stats, details, and information about any connected devices, including removable media - Shows Remote computer's IP address, LAN card information, Username and password and serial number - Can manage remote PC remotely or remotely logon it using its credentials - Hide remote computers which are connected to the local network Remote Device Explorer is a powerful and reliable tool to view remote computers in your network. As the name implies, the application allows you to view remote computer information (IP address,

username, password, and other details) and to enable remote access to the computer (use its credentials to logon). Its strength lies in the amount

Remote Device Explorer Crack+
